

Exception Screens - Flow V2

📄 The exception flow screens you might encounter.

Exception screens occur as a result of actions that cause a divergence from the flows provided. Let's see the kinds of exception screens a user may see and why.

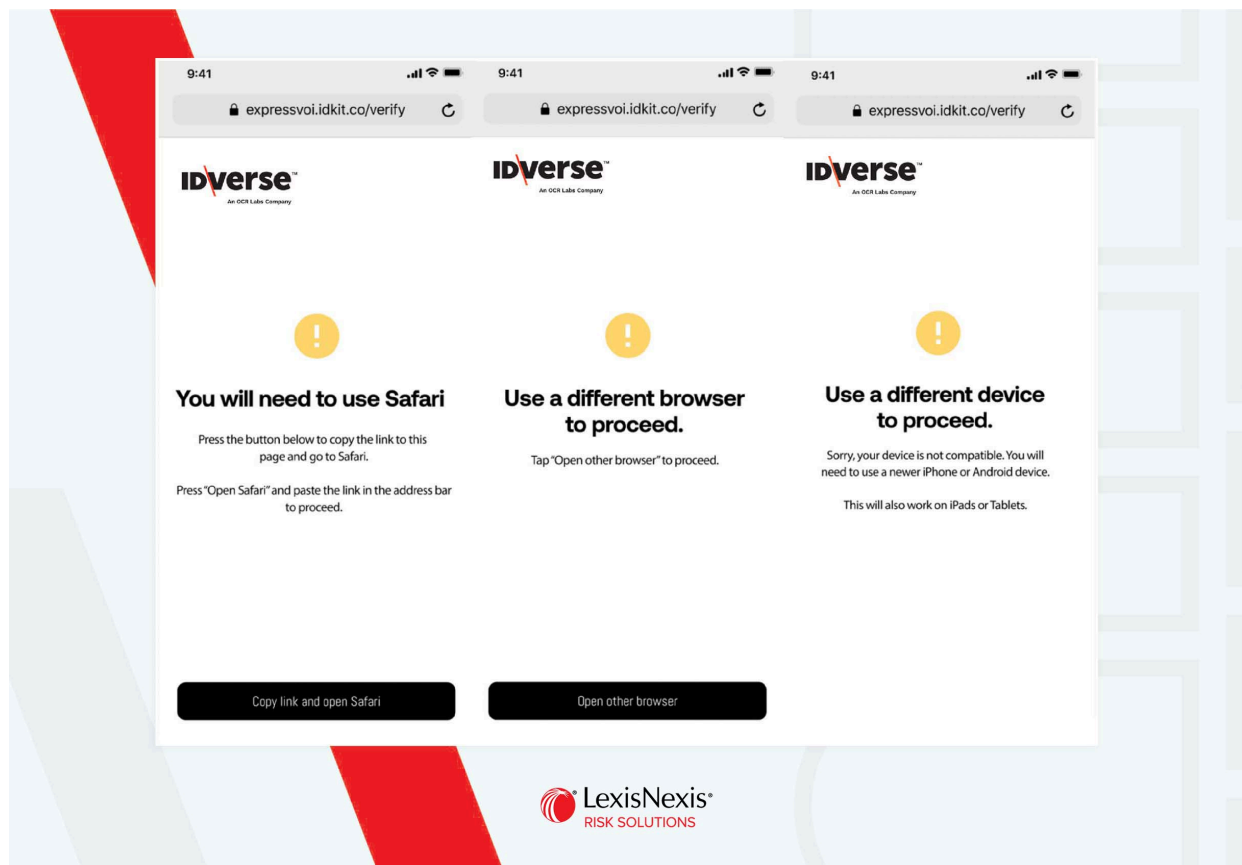

1. Verification Expired

If the verification link has expired, i.e., 48 hours (configurable) have passed since it was first sent, the user may see this screen. They will have to request a new verification link to complete the verification.

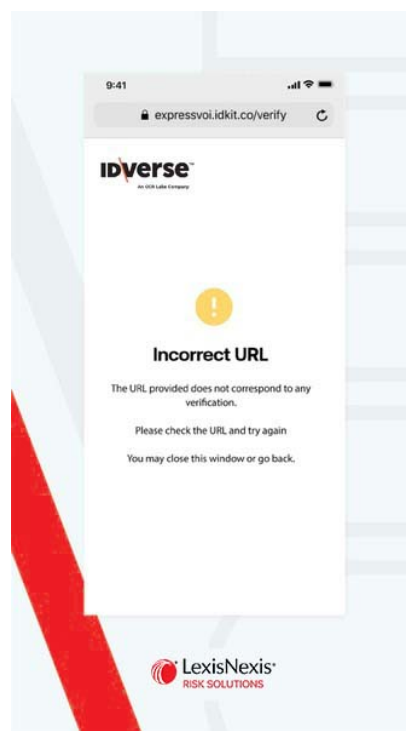

2. Incompatible Browsers or Devices

Suppose the users use an incompatible browser or device. In that case, they will be prompted to use a different browser supported by us or a newer device that supports the Enterprise verification process.

3. Incorrect URL

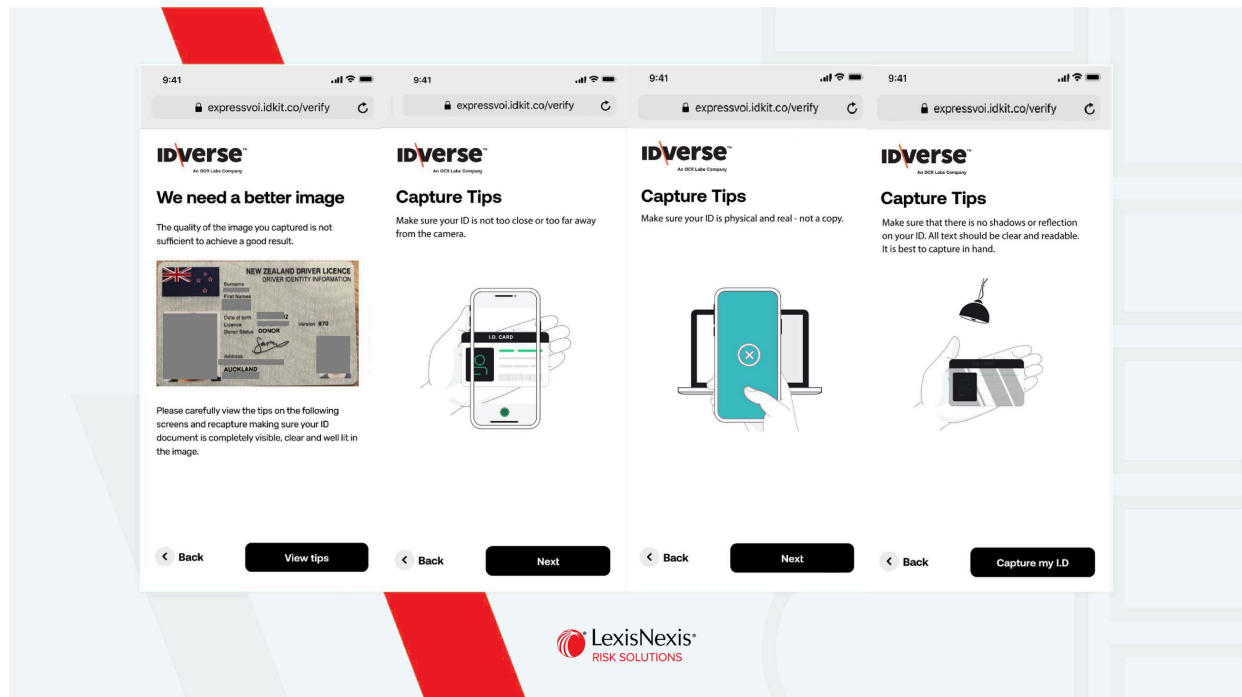

The following screen will appear if the URL is incorrect or does not correspond to any verification transaction. The user needs to recheck the URL and try again.

4. Recapture Image

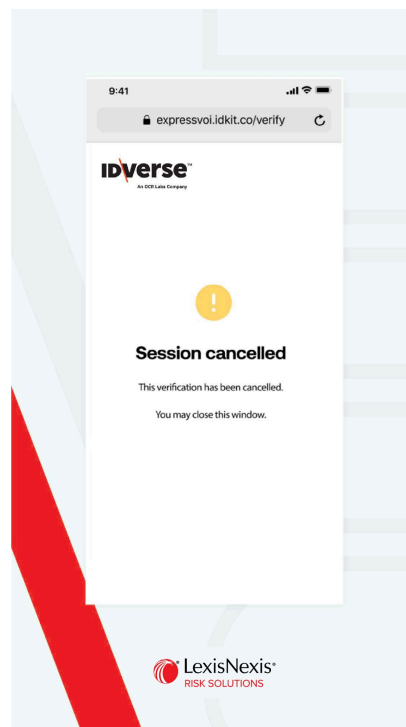

Suppose the quality of the ID document image captured is not clear enough. In that case, the user will be shown a set of instructions with animations to capture the ID document correctly.

They will only be shown this set of capture tips once so that the user does not get stuck in a loop. We will always accept the third image taken as long as we can determine it's an accepted document type.

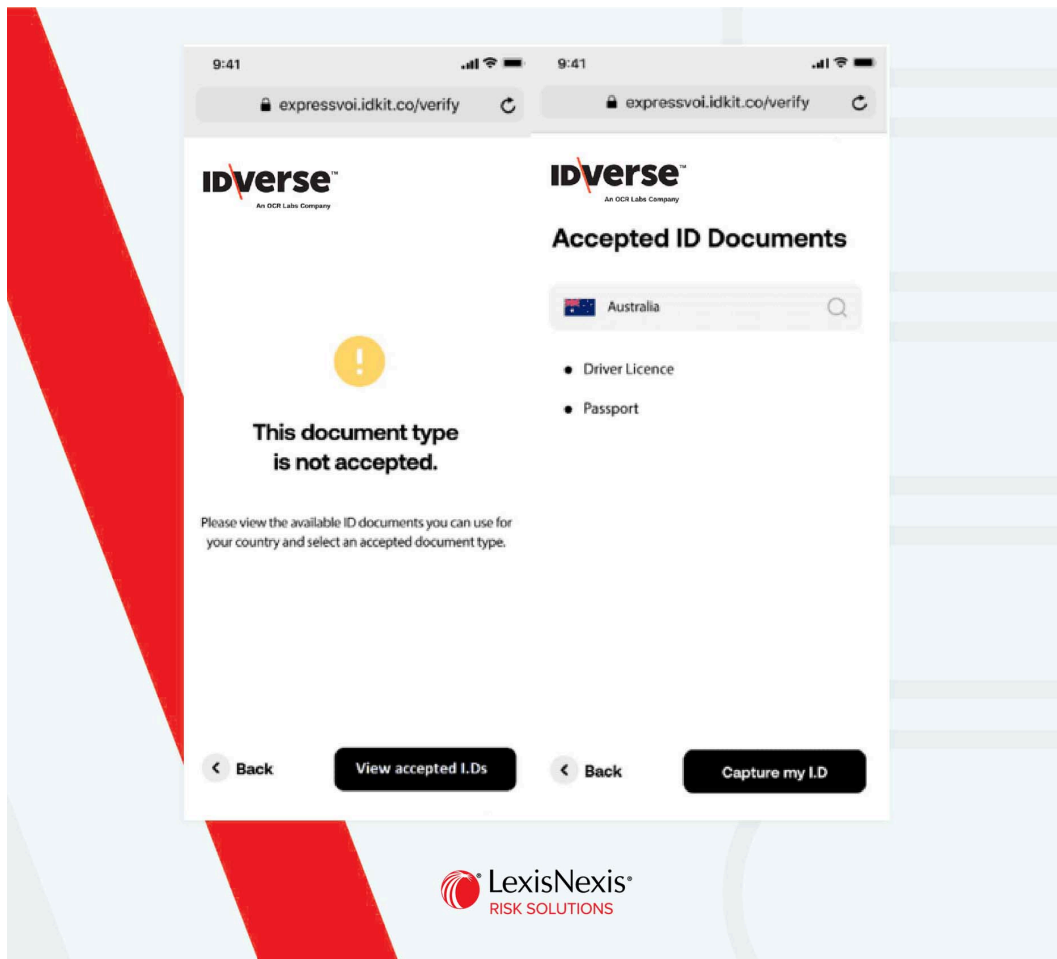

5. Session Cancelled

If the session is cancelled for any reason, e.g., from the portal by the admin, this screen will appear, showing the user that the verification session has been cancelled.

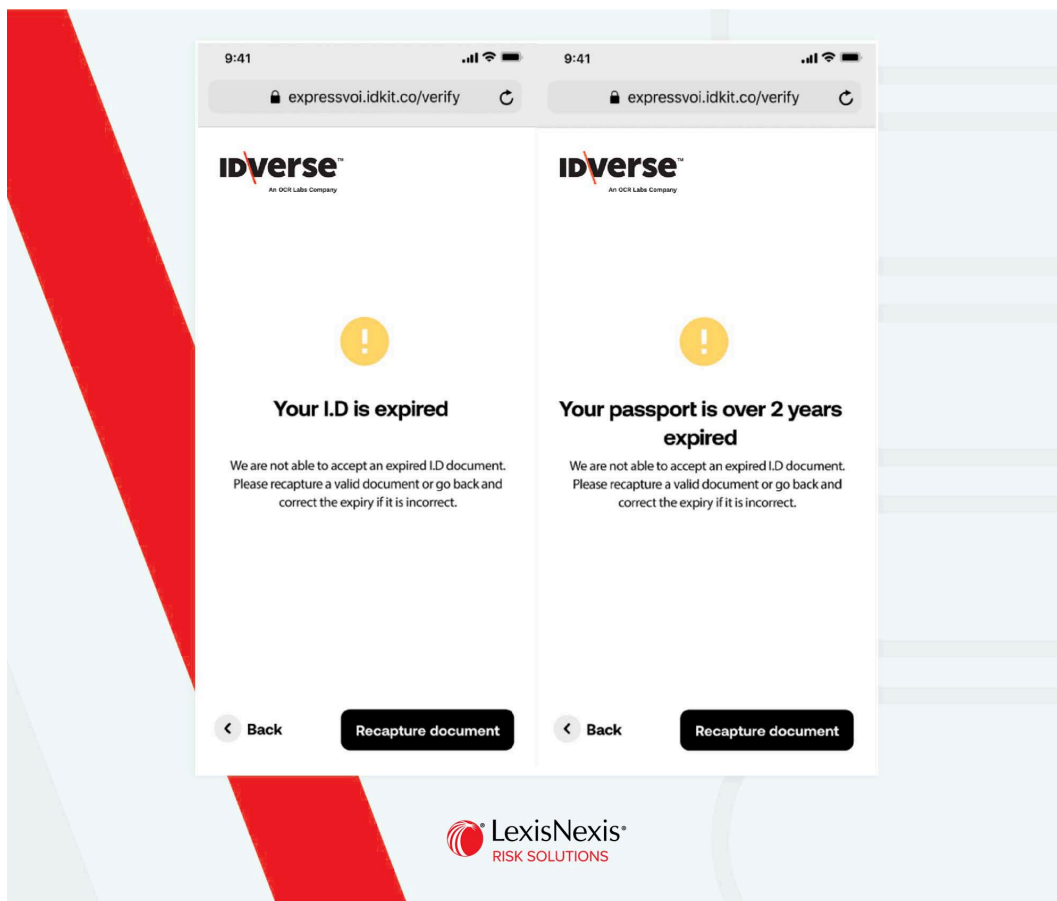

6. Invalid Document Type

Uploading an ID document that is not supported will result in an error telling the user that we do not support this document. They will be shown a list of acceptable ID documents on the next screen.

7. Expired Documents

Suppose a user uploads a document that has expired or exceeded the minimum acceptable period after expiry. In that case, they will be prompted to either recapture the ID document with a valid expiry date or go back and edit the expiry date if it was extracted incorrectly.

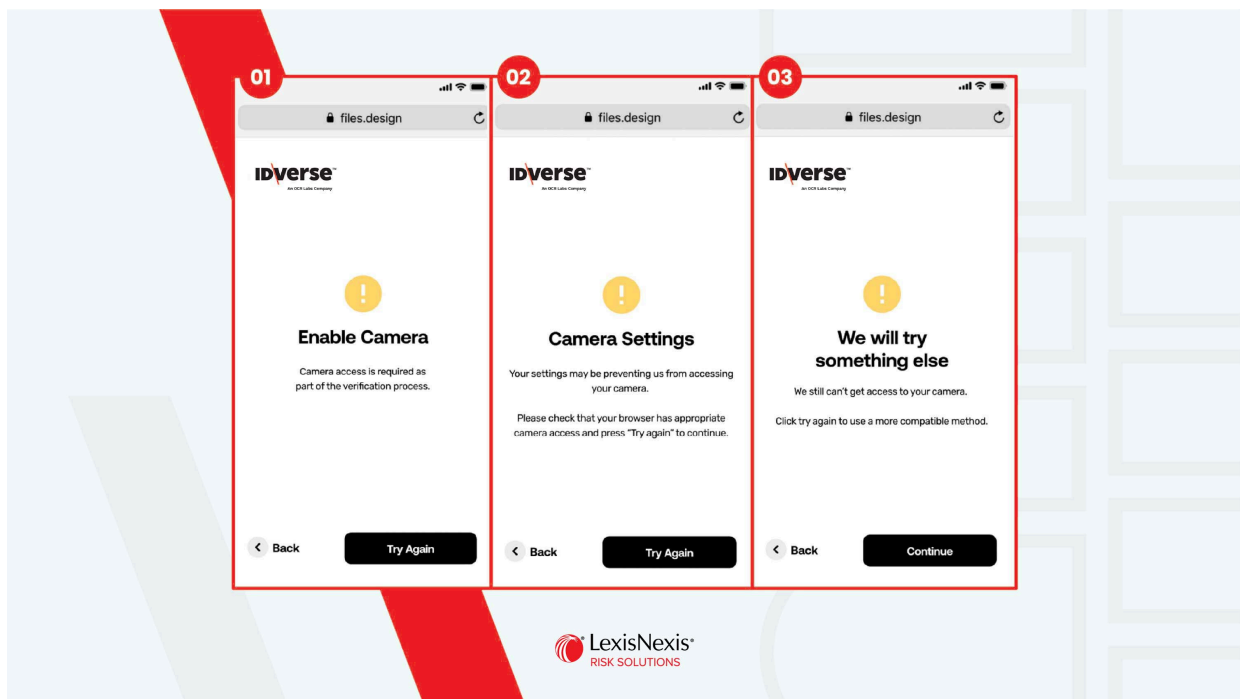

8. Camera Access

An alternate flow will be triggered if the device is compatible with the video flow but cannot gain access to the camera. The end-user will be unaware that they are going through a different flow. Instead of the usual tips screen for liveness, they will see a variation with different content and take a selfie image of their face rather than being guided through the video streaming interface.

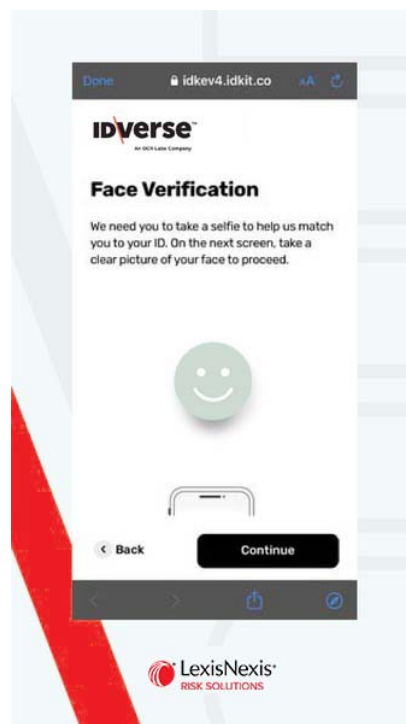

8.1 Alternate Flow

Three possible exception screens are shown if we cannot gain permission to access the camera.

1. Firstly, a screen will prompt the end-user to grant the camera access.
2. If we can't get permission, we will notify the end-user that there might be some issue with their settings.
3. If we still can't get access for the third time, we will let the end-users know we will try something else.

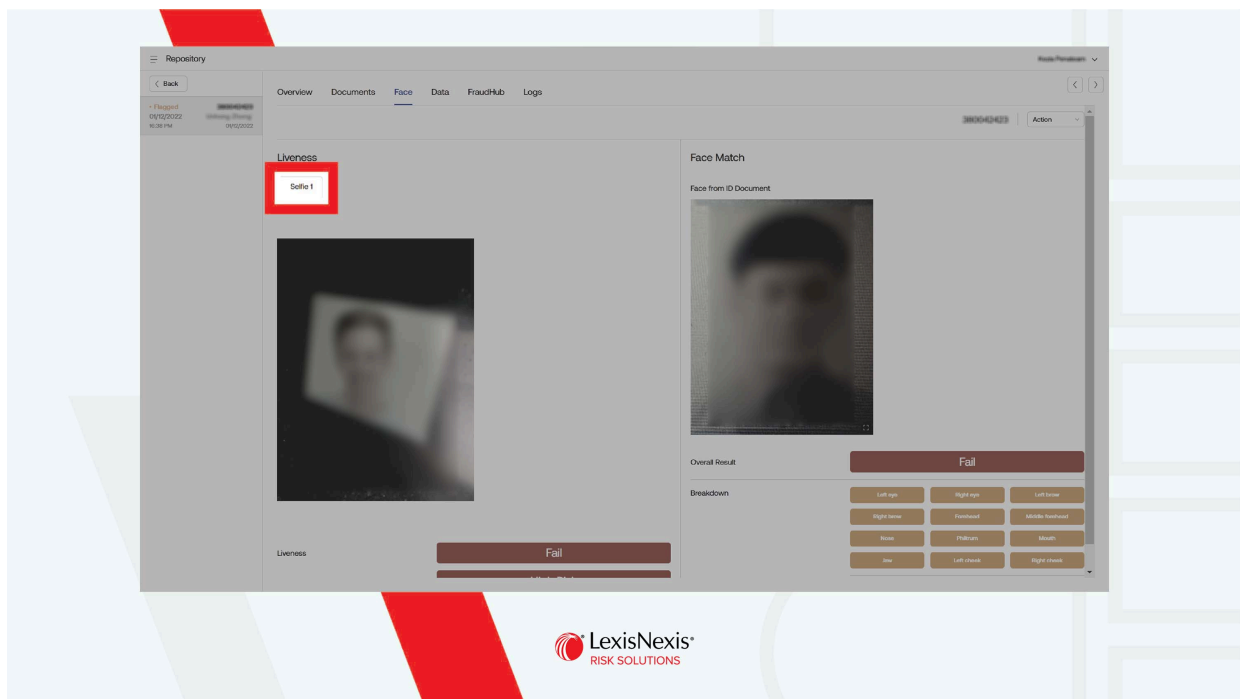

4. End-users can then continue the verification process with an alternate flow. They will then see the "selfie tips" screen and can capture a selfie instead of a liveness video and complete the verification.

8.2 Alternate Flow Results

In the portal, an alternate flow verification will display "Selfie 1" instead of "Capture 1" inside the repository and an image instead of a liveness video. All other results are displayed and mean the same thing inside the **Face** tab, i.e., whether liveness was achieved and whether there is a low or high risk of a spoofing attack.

While our image-based liveness functionality substitutes the video streaming liveness functionality, the underlying liveness algorithm remains the same.

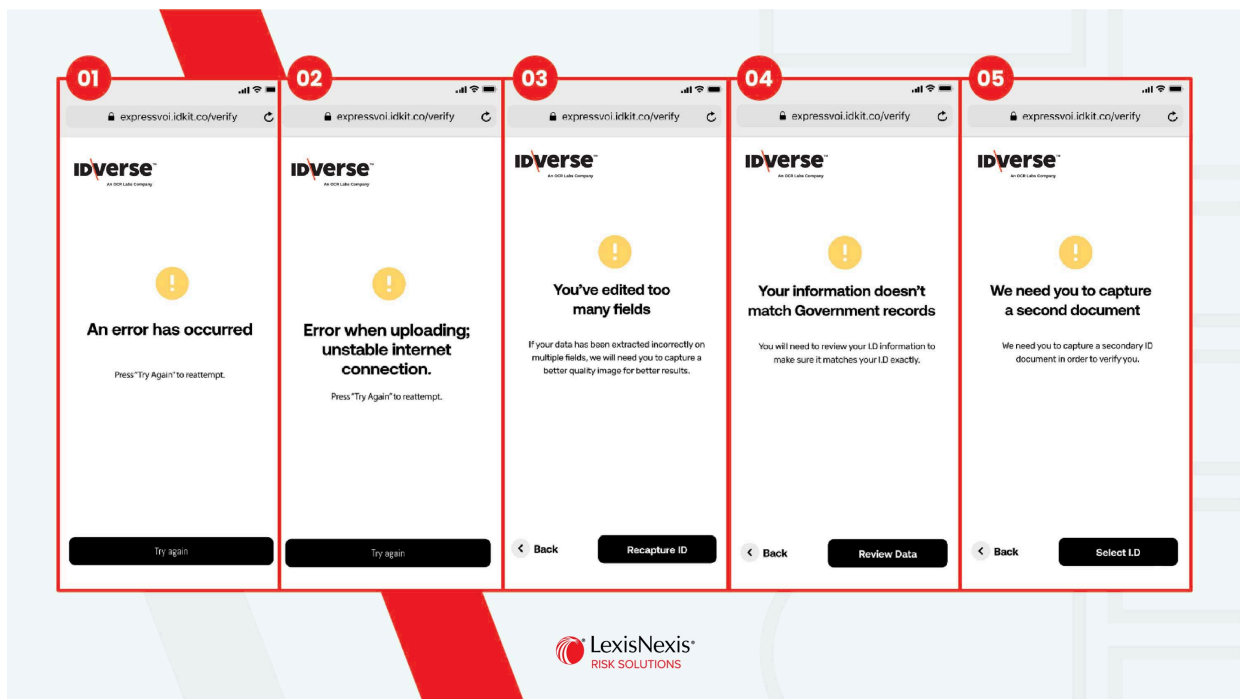

Info!

If the checks cannot be performed on the selfie image, the engines will flag the transaction.

9. Miscellaneous Exception Screens

In addition to the ones mentioned above, users may additionally encounter the following exception screens:

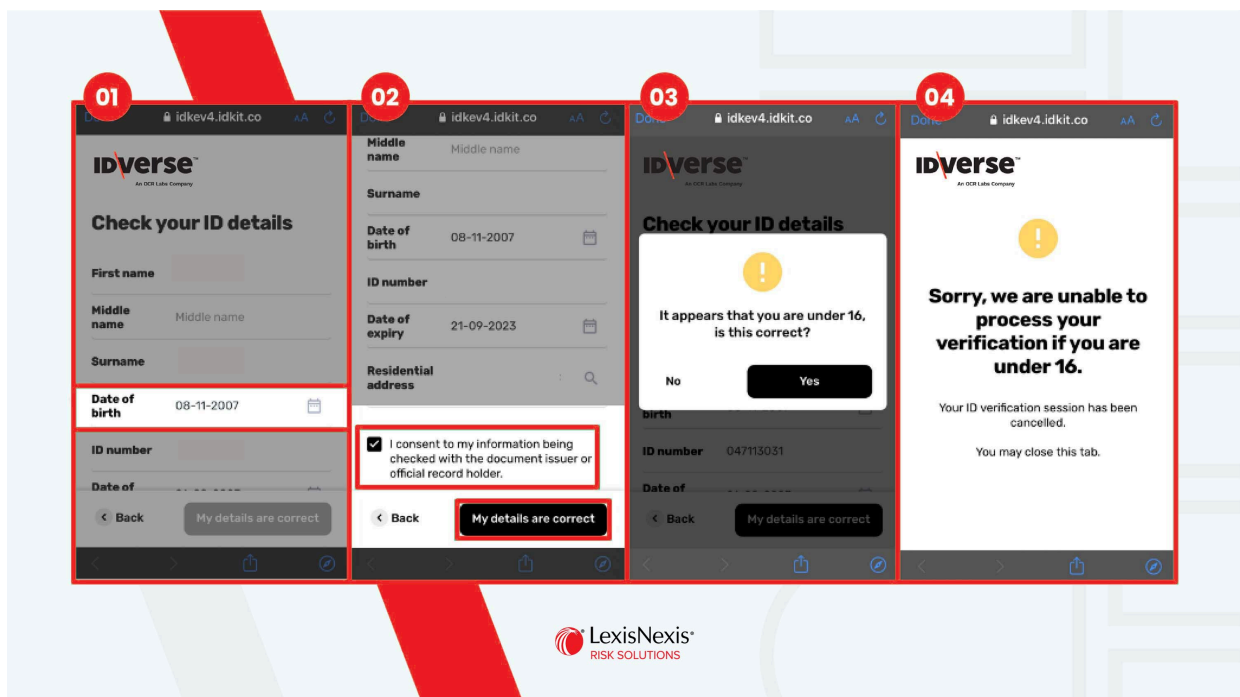

1. An error occurred due to non-conformance with the requirements, prompting the users to try again.
2. Failure to upload documents due to an unstable internet connection.
3. If the user has edited too many fields from the extracted data, they may be asked to recapture the ID document.
4. If the ID data does not match the government records, we will prompt the user to review their data again.
5. Similarly, if the user has selected more than one document, they will be prompted to capture their second ID document and follow similar steps as for the first ID document.

10. Age Limit

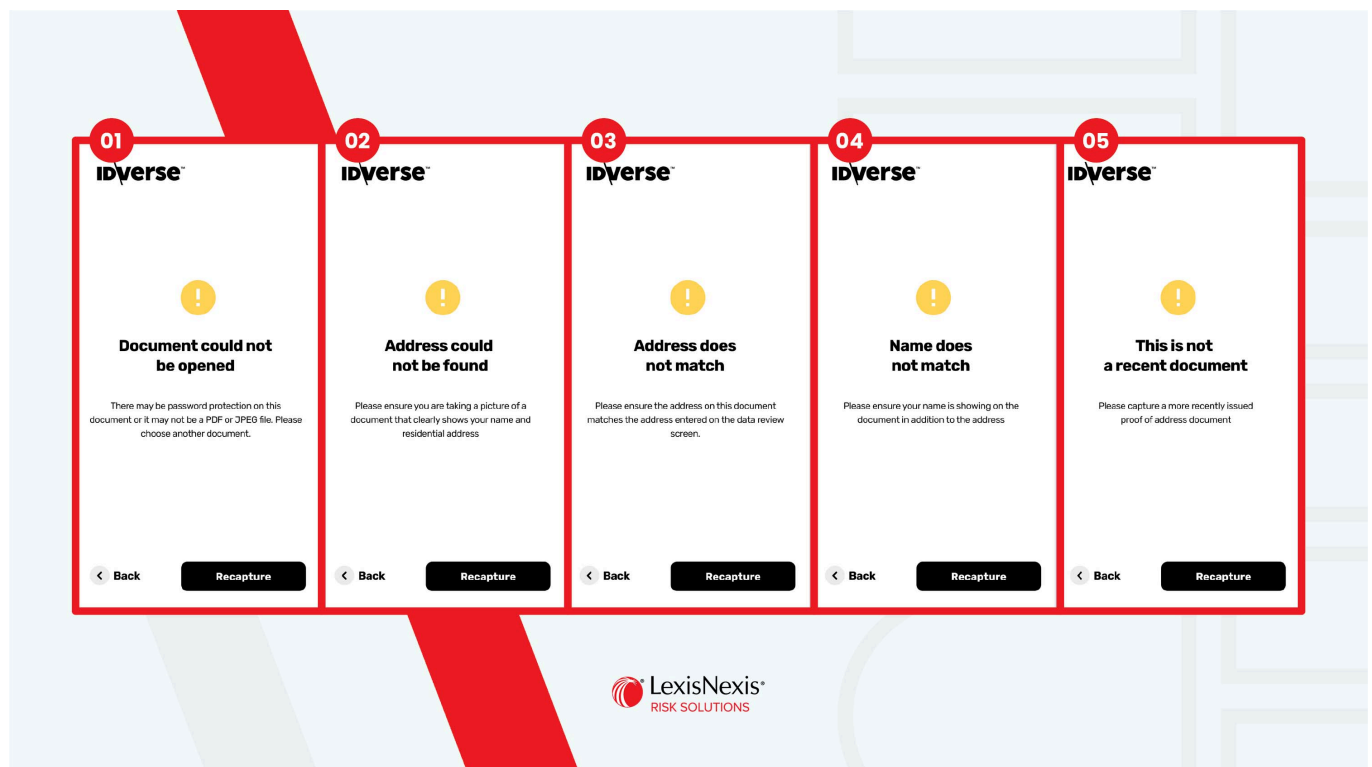

If you change the **Date of Birth** value and it turns out to be under 16 years, you will get an age limit screen.

1. After capturing the ID document, you will review the ID details. You can modify the available fields, i.e., Date of Birth.
2. Accept the consent and click the **"My details are correct"** button.
3. A confirmation pop-up will appear to confirm if you are under 16 years old.
4. If yes, you will get an age limit screen, and we cannot process your verification.

11. POA Error Handling

If there is an issue during the POA capture, you will be met with one of the following error screens:

There are several reasons why an error may occur. These are:

1. **Document could not be opened:** the document is protected, corrupted or is not of the right file type.
2. **Address could not be found:** there was no address detected on the POA document.
3. **Address does not match:** the address from the POA document does not match the address from the primary ID (POA flow) or the address that has been supplied (POA Only flow).
4. **Name does not match:** the name from the POA document does not match the name from the primary ID (POA flow) or the address that has been supplied (POA Only flow).
5. **This is not a recent document:** the date(s) extracted from the POA document are older than the recent document threshold. IDVerse has this value set as 365 days.

We Are Here to Help!

If you encounter an issue, find a bug, or require assistance, please contact our [Support Desk](#) to find the solution. Don't forget to provide all the critical information about the issue.
