

Multi Check Flow

🤖 Assess the users' identity check results real time with an embedded DVS check.

Overview

Multi Check Flow (available on both Flow V2 and Flow V5) is a method for running a Document Verification System (DVS) check against the user's data during the mobile flow. It verifies the personal data attributes via a third-party data verification source.

If the details cannot be verified, it provides real-time feedback by asking the user to check their details. If it fails for a second time, the user is asked for a different form of ID.

🚩 Note

Multi Check Flow is only available at a channel level if data is not enabled on the other channel(s).

We currently support the following data providers:

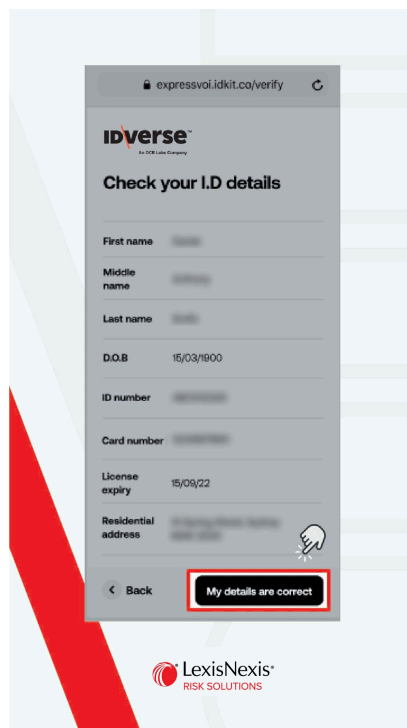

- GreenID (AU)
- IDMatrix (AU)
- DataConnect (AU DVS)
- NextGen DVS
- Data Zoo

📘 Note

Multi check flow is not supported with Assisted Flows.

Initial Step

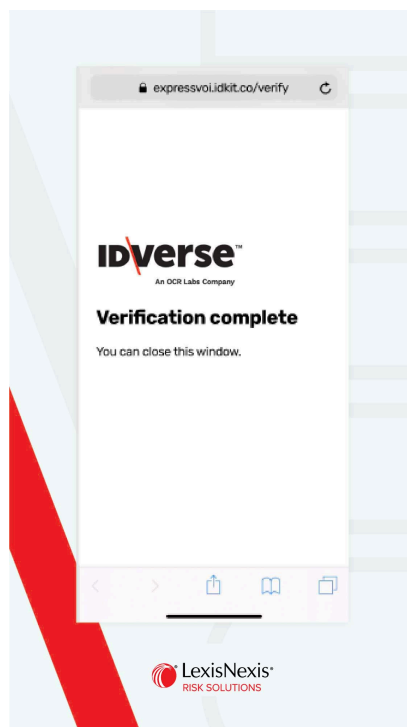

The Multi Check Flow will be initiated when users approve the details of their extracted data by clicking the "**My details are correct**" button. This will trigger a process to run a data check to verify their data.

Results

1. Verification Complete

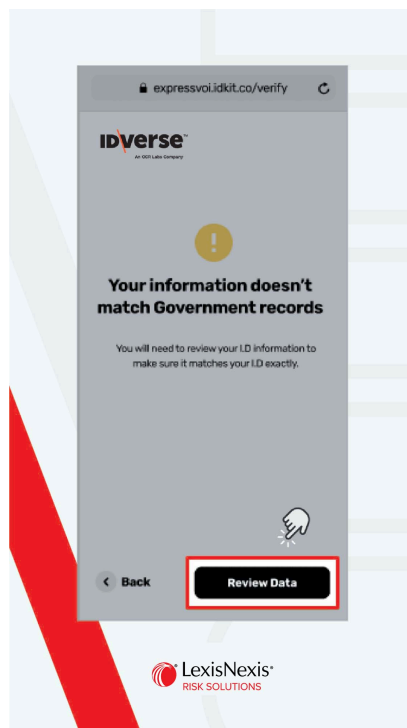

If there is a match between the user's data and the third-party records, the mobile flow will continue to capture liveness, then display the "Verification complete" screen.

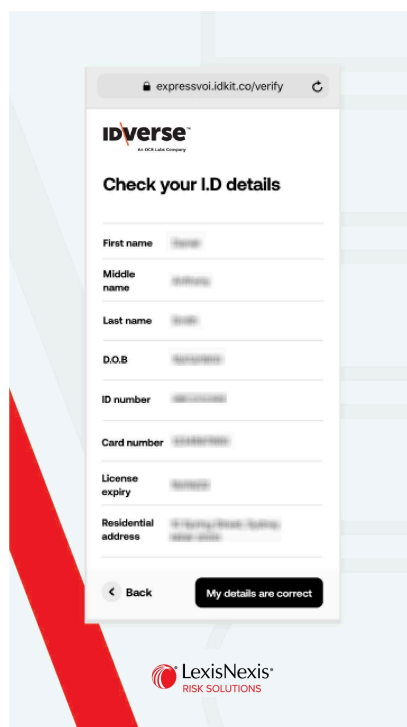

2. Verification Fail

2.1. The submitted data does not match the government records

1. The users will get the following screen if the third-party database does not find any compatibility between the submitted data and government records.

Thus, we will redirect them to recheck the ID details.

Info

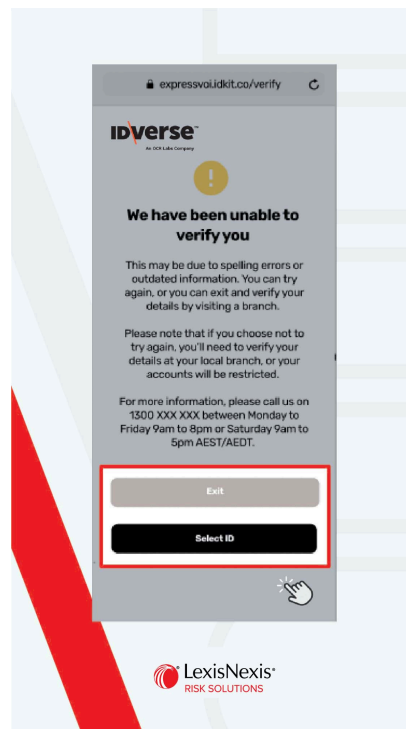

Users can check if there's any incorrect personal information in the available fields and modify the inaccurate data to a maximum of three fields.

2.2. There are spelling errors or outdated information

The users will see the screen below if there are spelling errors or outdated information. They can redo the verification by clicking on "Select ID".

Info

It is recommended to use a different ID type to redo the verification process to avoid the same error.

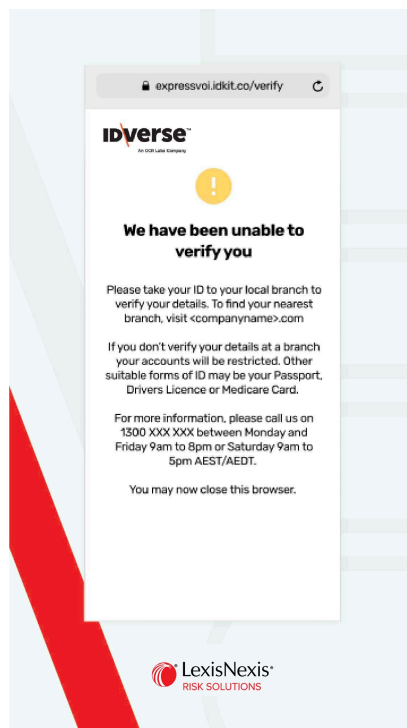

Should the user exit the verification by clicking on the **Exit** button, they will be asked to visit the local branch to verify the details in person.

It's a configuration we can change, so the **Exit** button display is optional.

Info

The Enterprise system will stop the verification process if the user exits the verification. However, the transaction status will remain "IN PROGRESS" until its expiration, so the user can return to it and start again.

Note

You must be using version 3.5 of the API in order to consume details of multiple data checks.
